

Financial Instruments Scenarios

GDP Growth and WACC Outcomes

DGE-METRIC Team

June 2026

- Scenarios shown: PDP8_GF_A, PDP8_GF_B, PDP8_GF_C compared to Baseline.
- Metrics: GDP growth and renewable-sector WACC.
- Deviations are reported against Baseline; 5-year grouped bars summarize medium-term differences.

Scenario Input Summary (from workbook)

Metric	PDP8_GF_A (Scenario A)	PDP8_GF_B (Scenario B)	PDP8_GF_C (Scenario C)
WACF	6.425%	7.367%	5.067%
Green bond share (sov+corp)	20.0%	15.0%	24.5%
Bank credit share	67.0%	78.0%	44.5%
Concessional + blended share	13.0%	7.0%	31.0%

Metric	PDP8_GF_A (Scenario A)	PDP8_GF_B (Scenario B)	PDP8_GF_C (Scenario C)
Sovereign bond rate	4.0%	4.3%	3.6%
Bank lending rate	7.5%	8.0%	7.0%
Annual financing cost (USD bn)	8.7	10.0	6.9
Annual saving vs Scenario B (USD bn)	-1.3	–	-3.1

Policy Comparison Table (Deviation vs Baseline)

Scenario	GDP 2030	GDP 2040	GDP 2050	WACC 2030	WACC 2040	WACC 2050
PDP8_GF_A	+0.070	+0.005	-0.023	-0.400	-0.386	-0.159
PDP8_GF_B	-0.120	+0.003	-0.017	+0.778	+0.719	+0.311
PDP8_GF_C	+0.309	+0.011	-0.047	-2.089	-2.119	-0.983

GDP entries are percentage-point deviations in annual growth. WACC entries are percentage-point deviations in renewable-sector WACC.

GDP Growth: Levels

GDP Growth: 5-Year Average Deviation from Baseline

WACC (Renewables): Levels

WACC (Renewables): 5-Year Average Deviation from Baseline

- Core mechanism: a lower renewable-sector WACC reduces the user cost of capital, supports earlier renewable investment, and can temporarily lift aggregate growth during the transition.
- PDP8_GF_C shows the strongest WACC reduction and the largest near-term GDP-growth gain (2030), consistent with stronger front-loading of capital formation.
- PDP8_GF_B raises WACC relative to baseline and is associated with weaker near-term growth, indicating tighter financing conditions can delay reallocation and expansion.
- By 2050, GDP-growth deviations are small or slightly negative across scenarios, suggesting convergence in growth rates as level effects are absorbed and transition dynamics mature.
- Primary evidence in this deck comes from 5-year grouped bars: persistent WACC wedges map into persistent, but diminishing, growth differentials over successive periods.
