

Net Zero Scenario Comparison

NZ vs Baseline

DGE-METRIC Team

June 2026

- Comparison shown: NZ (Net Zero) versus Baseline.
- Metrics cover macro outcomes, energy channels, and emissions.
- Deviation panels show NZ minus Baseline effects directly.

GDP and Growth: 5-Year Average Deviations

Investment and Consumption: 5-Year Average Deviations

Energy Intensity and Prices: 5-Year Average Deviations

Final Energy Demand: 5-Year Average Deviations

Emissions and GDP Growth: 5-Year Average Deviations

- NZ transition effects can be decomposed into demand reallocation, relative-price adjustment, and emissions-abatement dynamics.
- The 5-year grouped bars provide the main medium-term signal by averaging short-run volatility and highlighting persistent wedges versus baseline.
- GDP-level and investment-share deviations indicate how transition support and adjustment costs net out over successive policy windows.
- The split of final energy demand into grid and PV channels shows whether the transition relies more on centralized electrification or distributed energy uptake.
